

ABSTRACT OF THE DISCLOSURE

Document processing systems are provided that are capable of facilitating scanning of one or more documents via multiple scanners. In this regard, a preferred document processing system includes a document assembly system. The document assembly system is configured to electrically communicate with a first scanner, which may be assigned to a first group of scanners, and a second scanner, which may be assigned to a second group of scanners. The scanners provide scan information to the document assembly system. The document assembly system is configured to correlate the scan information received from the first scanner with the scan information received from the second scanner. Computer readable media and methods also are provided.
